Myntra Customer Analysis Report

Dashboard-Based Business Review

Prepared from: Myntra Customer Analysis dashboard screenshot supplied by the user
Report focus: Marketplace scale, discounting, assortment value, seller landscape, customer satisfaction, and recommended actions
Brand: Myntra

---

1. Executive Summary

The dashboard presents a large-scale fashion marketplace with four clear signals:

1. **Very high marketplace scale:** the dashboard displays a **Sum of ID of 5BN**, indicating a substantial volume of product or customer-level records in the analyzed dataset.
2. **Strong promotional intensity:** the displayed **Average Discount is 172.85**, suggesting discounting is a central commercial lever. The unit and calculation logic should be validated before using this figure for margin decisions.
3. **Broad assortment value:** the dashboard shows a **Sum of Price of 184M**, pointing to significant catalog depth across value, mid-market, and premium products.
4. **Customer-experience risk:** the displayed **Average Rating is 1.77**, a low result if ratings are measured on a conventional five-point scale. This should be treated as the most urgent quality and trust signal in the dashboard.

Overall conclusion

Myntra appears to have the scale and assortment breadth to support strong growth, but the marketplace should reduce dependence on blanket discounting and improve rating quality, seller reliability, and product confidence. The priority is to convert scale into **profitable, trusted, repeat shopping behavior**.

---

2. Dashboard KPI Snapshot

KPI	Dashboard value	Business interpretation
Sum of ID	**5BN**	Indicates very high record or interaction scale in the analyzed data. It should not automatically be interpreted as unique customers without confirming the ID definition.
Average discount	**172.85**	Signals strong promotional activity. The measure should be validated for unit, percentage format, and whether it is calculated before or after data cleaning.
Sum of price	**184M**	Represents a large total listed-price value across the visible assortment. It is a catalog-value indicator, not necessarily realized sales revenue.
Average rating	**1.77**	Indicates a potential trust, quality, review, or data-quality issue if the rating scale is 1–5.

> **Data note:** The report preserves the figures exactly as displayed in the dashboard. Metric definitions, units, currency, time period, and denominator logic were not visible in the supplied screenshot and should be confirmed before executive or financial use.

---

3. Key Finding: Marketplace Scale Is a Major Strategic Asset

The dashboard's **5BN Sum of ID** is the strongest signal of scale. A dataset of this magnitude can support detailed segmentation by:

- customer cohort and lifecycle stage;
- category, brand, seller, and product;
- discount band and price tier;
- rating, review volume, and return behavior;
- geography, device, channel, and campaign exposure.

Business implication

Scale can improve personalization and merchandising only when the underlying identifiers are reliable. The first analytical control should be to distinguish among:

- unique customers;
- unique products;
- order or transaction IDs;
- catalog-row IDs; and
- repeated records created by joins or product variants.

If the 5BN figure is a raw ID sum rather than a count of unique customers, it should be reframed in future dashboards to avoid misinterpretation.

---

4. Key Finding: Discounting Is Central to the Current Value Proposition

The dashboard displays an **Average Discount of 172.85** and a stepped discount distribution. The pattern suggests that promotional pricing is heavily embedded in the customer journey.

What this may mean

- Discounts are being used to acquire price-sensitive shoppers.
- Promotional depth may be supporting conversion in high-competition categories.
- The marketplace may be creating a reference-price habit where customers wait for offers.
- Sellers may be competing on discount instead of product quality, availability, or brand trust.

Commercial risk

If discounting is not segmented, the business may sacrifice margin on customers who would have purchased at a lower promotional intensity. It can also weaken premium-brand perception and make full-price conversion harder.

Recommended measurement upgrade

Track discount effectiveness using:

- conversion rate by discount band;
- contribution margin after discount and returns;
- repeat purchase rate after a discounted first order;
- full-price conversion in the following 30–90 days;
- customer lifetime value by acquisition discount;

- seller-level discount efficiency.

> **Important:** The dashboard value of 172.85 should be validated. If it is intended to be a percentage, the calculation or field definition may require review because the number is outside a conventional 0–100% range.

---

5. Key Finding: Assortment Value Creates a Wide Price Architecture

The **184M Sum of Price** and the seller-level price curve indicate a broad range of listed products. The dashboard visibly includes a long price tail, from everyday fashion and beauty products through higher-priced luxury, electronics, and lifestyle items.

Strategic opportunity

Myntra can organize this breadth into a clear price architecture:

Price tier	Customer role	Recommended merchandising approach
Entry value	Acquisition and trial	Curate highly rated, low-return products; use targeted offers rather than blanket discounts.
Mid-market	Core conversion and repeat	Build bundles, outfit recommendations, and private-label cross-sell journeys.
Premium	Margin and brand trust	Emphasize authenticity, quality proof, service, and verified seller credentials.
Luxury / niche	Aspiration and halo	Use editorial storytelling, limited drops, and high-confidence product information.

The central principle is to make price breadth feel intentional rather than fragmented.

---

6. Key Finding: Average Rating Is the Most Urgent Watchpoint

The dashboard displays an **Average Rating of 1.77**. If the data uses a standard five-point rating scale, this is materially low and can reduce conversion, repeat purchase, and customer trust.

Possible root causes to investigate

1. Product-quality inconsistency across sellers.
2. Incorrect product descriptions, images, or size information.
3. Delivery delays or packaging problems.
4. Return and refund friction.
5. Review manipulation, duplicate records, or rating-field errors.
6. Averages being calculated across products with very different review counts.

Recommended diagnostic cuts

- Rating by category and seller.
- Rating by brand and product age.
- Rating by price tier and discount band.
- Rating by delivery promise and actual delivery time.
- Rating by return reason.
- Average rating weighted by review count versus simple product average.

Business implication

The rating metric should be treated as a **trust KPI**, not merely a product KPI. Improving rating quality can reduce the need for deep discounts by increasing customer confidence at the moment of purchase.

---

7. Seller and Brand Landscape

The dashboard includes seller-level views for both rating totals and average price. The visible pattern suggests a marketplace with:

- a small group of recognizable hero brands;
- a wide long tail of sellers and products;
- high-value sellers anchoring the premium price range; and
- a need to balance selection breadth with quality control.

Examples visible in the dashboard’s brand/seller storytelling layer include **Biotique, HRX by Hrithik, Roadster, Puma, Adidas, WROGN, H&M, Tissot, and Dyson**. These names should

be treated as portfolio examples unless a source dataset confirms their precise ranking or performance.

Recommended brand operating model

Hero brands: protect availability, visibility, and authenticity.
Growth brands: use targeted discounts, content support, and campaign testing.
Long-tail sellers: introduce stronger catalog, fulfillment, and quality gates.
Premium brands: protect price integrity and emphasize trust signals over discount depth.

---

8. Customer and Marketplace Growth Playbook

8.1 Acquisition: Make discounting more precise

- Replace broad discounts with category-, cohort-, and seller-specific incentives.
- Use first-order offers to acquire customers, then reduce discount depth for repeat behavior.
- Measure acquisition quality through 30-, 60-, and 90-day repeat rates.

8.2 Conversion: Improve confidence at product detail page

- Prioritize verified reviews, fit guidance, authentic imagery, and clear return policies.
- Highlight product quality signals next to price and discount.
- Use brand trust and seller ratings as conversion tools.

8.3 Retention: Build a value ladder

- Move customers from entry-price products into mid-market and premium categories.
- Create outfit, occasion, and category bundles.
- Personalize recommendations based on prior discount response and rating tolerance.

8.4 Seller quality: Make marketplace reliability visible

- Introduce seller-level quality scorecards.
- Monitor cancellations, returns, defects, delivery adherence, and review quality.
- Reward sellers that sustain strong customer outcomes without excessive discounting.

8.5 Data governance: Make the dashboard decision-ready

- Define every KPI and its unit.
- Separate sum, count, distinct count, and average measures.
- Add time-period filters and currency labels.
- Include data refresh date, record count, and quality checks.

---

9. Suggested Management Dashboard Upgrade

A future version of the dashboard should add the following sections:

Customer health

- Active customers and repeat customers.
- New versus returning customer mix.
- Customer lifetime value.
- Repeat rate by discount band.

Commercial health

- Gross merchandise value.
- Net sales after discounts and returns.
- Contribution margin.
- Average order value.

Experience health

- Average rating and review volume.
- Return rate and return reasons.
- Cancellation rate.
- Delivery promise adherence.

Marketplace health

- Seller quality score.

- Brand-level conversion.
- Stock availability.
- Discount efficiency.

---

10. Priority Actions for the Next 90 Days

Priority	Action	Success measure
1	Validate the definition and unit of the 172.85 average discount.	Confirmed metric dictionary and corrected display if required.
2	Run a rating root-cause analysis for the 1.77 average rating.	Rating improvement plan by category, seller, and return reason.
3	Build discount-band profitability reporting.	Margin and repeat-rate view by discount band.
4	Create hero-brand and long-tail seller scorecards.	Seller visibility linked to quality, availability, and customer outcomes.
5	Upgrade the dashboard with time, currency, and distinct-count controls.	A decision-ready dashboard used consistently by commercial teams.

---

11. Final Takeaway

The Myntra dashboard shows a marketplace with **large-scale data, deep assortment value, and strong promotional energy**. The next stage of growth should focus on converting those assets into **higher trust, better customer experience, and more profitable repeat behavior**.

The most important leadership message is simple:

> **Use scale to personalize, use discounts selectively, and use product quality to earn full-price loyalty.**

Source and Limitations

This report is based on the supplied Myntra customer-analysis dashboard screenshot. The screenshot visibly provides four headline metrics—**5BN Sum of ID, 172.85 Average Discount, 184M Sum of Price, and 1.77 Average Rating**—plus seller-level charts. Exact source rows, time period, currency, field definitions, unique-count logic, and underlying chart values were not provided. Any qualitative interpretation should therefore be validated against the underlying dataset before use in financial, operational, or external reporting.
